Sales Data Wrangling in Tableau

- First add my file as text file.
- Use live connection in our notebook connecting directly to PCs hard drive.
- Change the names of the columns to easily understandable names and removing space between the words.
- Hide the columns with only one value, i.e, Managed by and First Line designation column.
- PQ.client.date and PQ.Vendor.date are two columns with dates and a string value because of which the column is not detected as date.
- Group the dates in the above said columns year wise.
- Split the columns with long names with multiple separators. The columns are Manufacturing.Site and Vendor.Split. Do a custom split with (, - (space).
- Create a calculated field for [Line item QTY] / [Unit Measure Per Pack]. To have better and easy understanding of the behavior of sales rather than comparing the two columns.
- To see if our data is fine and healthy, we can also use Interpreter in Tableau. And after interpreting it was indeed healthy.
